## 1 Question 1

System is:

$$G(s) = \frac{-s + 3}{(s + 1)(s + 2)(s^2 + 2s + 4)}$$

### 1.1 part a

We used `get_fog` and `opt_app` to find first order time delay transfer function (FOTF).

- frequency

$$G(s) = e^{-1.45s} \frac{0.375}{0.9587s + 1}$$

- transfer function

$$G(s) = e^{-1.39s} \frac{0.375}{0.9428s + 1}$$

- optimum

$$G(s) = e^{-1.38s} \frac{0.383}{s + 1.021}$$

Figure 1: system and FOTD step responde

I used below cost function to see witch one fits better.

$$\text{Cost} = \int_0^8 |G(t) - G'(t)| dt, \quad G' \text{ is FOTD transfer function}$$

- frequency  
Cost = 1.5949
- transfer function  
Cost = 1.3208
- optimum  
Cost = 1.0345

Optimum hase minimum cost so we choise FOTD that used optimum function.

## 1.2 part b

Now design PID controller with following methods.

- ziegler nichols

$$G_c = \frac{4.756s^2 + 6.423s + 2.27}{0.1904s^2 + 2.76s}$$

Figure 2: step response with ziegler nichols PID controller

- refined ziegler nichols

$$G_c = \frac{3.099s + 2.27}{1.629s}, \quad H = \frac{1.051s^2 + 1.698s + 1}{0.09418s^2 + 1.434s + 1}$$

Figure 3: step response with refined ziegler nichols PID controller

- modified ziegler nichols

$$r_1 = 1.0, \quad p_b = 5 : 5 : 35$$

Figure 4: step response with modified ziegler nichols PID controller

- Cohen Coon

$$G_c = \frac{3.223s^2 + 7.463s + 3.189}{0.09188s^2 + 2.3s}$$

Figure 5: step response with Cohen Coon PID controller

- Cohen Coon revisited

$$G_c = \frac{3.374s^2 + 7.744s + 3.202}{0.09579s^2 + 2.378s}$$

Figure 6: step response with Cohen Coon revisited PID controller

- Astrom Haggglund

$$G_c = \frac{0.9211s^2 + 1.794s + 1.385}{0.06048s^2 + 1.247s}$$

Figure 7: step response with Astrom Haggglund PID controller

- Frequency based Astrom Hagglund

$$G_c = \frac{1.025s^2 + 1.666s + 1.355}{0.0688s^2 + 1.171s}$$

Figure 8: step response with Frequency based Astrom Hagglund PID controller

- CHR set point 0% overshoot

$$G_c = \frac{0.8439s^2 + 1.19s + 1.135}{0.06758s^2 + 0.9794s}$$

Figure 9: step response with CHR set point 0% overshoot PID controller

- CHR set point 20% overshoot

$$G_c = \frac{1.758s^2 + 2.581s + 1.797}{0.08893s^2 + 1.371s}$$

Figure 10: step response with CHR set point 20% overshoot PID controller

- WJC

$$G_c = \frac{9.298s^2 + 21.39s + 12.51}{0.4048s^2 + 10s}$$

Figure 11: step response with WJC PID controller

- optimum set point PID ISTE

$$G_c = \frac{1.993s^2 + 3.738s + 2.496}{0.07258s^2 + 1.447s}$$

Figure 12: step response with optimum PID controller

- optimum set point PI-D ISTE

$$G_c = \frac{4.219s + 2.41}{1.751s} \quad H = \frac{0.9836s^2 + 4.328s + 2.41}{0.191s^2 + 4.328s + 2.41}$$

Figure 13: step response with optimum PI-D controller

### 1.3 conclusion

ziegler nichols is very slow but refined ziegler nichols is better and faster. modified ziegler nichols is very slow. Cohen coon is slow and has high overshoot but cohen coon revisited is faster. Astrom haggglund is very good in doesn't have overshoot and system is fast but Frequency is a little slow. CHR is fast but overshoot method work strange. Zero overshoot has overshoot but 20% overshoot has lower overshoot. WJC work fast and have very small overshoot. Optimum PID work well but PI-D is a little slow. We don't what the system is so we can't select best controller it depends on our plant.

## 2 Question 2

System is:

$$G(s) = \frac{-s + 3}{s(s + 2)(s^2 + 2s + 4)}$$

### 2.1 part a

Integral plus Time Delay:

$$G = e^{-1.15s} \frac{0.375}{s(0.378s + 1)}$$

Figure 14: system and ITD step responde

Now we use foipdt function.

Figure 15: step response with foipdt PD controller

Figure 16: step response with foipdt PID controller

## 2.2 part b

Integral plus Time Delay:

$$G = e^{-1.33s} \frac{0.375}{s}$$

Figure 17: system and ITD step response

Now we use ipdtctrl function.

Figure 18: step response with ipdtctrl for ISE PD controller

Figure 19: step response with ipdtctrl for ITSE PD controller

Figure 20: step response with ipdtctrl for ISTSE PD controller

Figure 21: step response with ipdtctrl for ISE PID controller

Figure 22: step response with ipdtctrl for ITSE PID controller

Figure 23: step response with ipdtctrl for ISTSE PID controller

## 2.3 conclusion

Firt ITD function doesn't fit well but PD controller work very good but PID controller work very bad too slow for setteling time and has a high overshoot. system has integrator so we don't need to have integrator in controller and just make system slow and pendulous. Second ITD fits very good bad PD and PID controller don't work well. PD is far better than PID and PID is too slow and pendulous. In final PD controller used first method is the best fot this system.
